Andrii Kravets

Senior Android Developer

Profile

- Senior Android Developer with over 11 years of experience building complex Android applications, including offline-first, map-based, hardware-integrated, synchronization-heavy, and reliability-critical mobile systems. Experienced in commercial Android SDK core development, including lifecycle management, concurrency, and public API design. Strong background in Kotlin, Jetpack Compose, Kotlin Multiplatform, reactive state management, concurrency, multithreading, data synchronization, and state machine design.
- Leadership Experience: ~2.5 years of hands-on technical leadership across Tickets.ua, a FinTech project, and an Android training project — leading small teams of junior and middle developers, coordinating delivery, reviewing code, onboarding, and mentoring, with 20+ technical interviews conducted.
- Delivered production-grade features across 14 applications for US and Israeli clients. Hands-on experience throughout the full software development lifecycle, from architecture design to deployment, with direct collaboration with foreign customers and international teams.
- Experienced engineering mentor: guided 9 developers from scratch, 8 of whom now work professionally as Android engineers. I also have a strong personal and professional interest in diabetes-related healthcare products, especially CGM ecosystems, follower apps, alerting, and safety-sensitive mobile routines.

Tools and technologies

- **UI and Design:** Jetpack Compose, PreCompose, View Binding, Custom Views, Notifications, Widgets
- **Dependency Injection:** Hilt, Dagger 2, Koin
- **Networking and APIs:** Retrofit, Google Drive API, GetStream, GraphQL, App Links, Google Maps, Mapbox
- **Database and Storage:** Room, Realm, SQLite, Database Normalization, Firebase Firestore
- **Testing:** JUnit, Mockito, MockK, Espresso, Instrumentation Tests, Integration Tests
- **Asynchronous Programming:** Kotlin Coroutines and Flows, RxJava2
- **Architecture & Cross-platform:** MVVM, Clean Architecture, UseCase Pattern, Kotlin Multiplatform (KMP)
- **Build and Project Management:** Gradle Kotlin DSL, Git, Crashlytics
- **Integration Services:** Cloud Firestore, Firebase Config, Google Analytics, NewRelic, Kommunicate, DataSpike, OneSignal
- **Communication Protocols:** Google Protocol Buffers, TLV Packets, Bluetooth, USB Accessories
- **Other:** Android SDK, Workers, Broadcast, Services, Navigation Component

Employment history

Android Developer at Intellias

July 2024 – Present

Navigation SDK — Core Engineering (Current Project)

Project outline: Developing core components of a commercial Android navigation SDK, focusing on lifecycle management, concurrency, native engine integration, API design, and reliability.

Tools and technologies: Kotlin, Multithreading, Synchronization, JUnit, MockK.

Key Contributions & Impact

- **SDK Core & Lifecycle Architecture:** Developed and improved core SDK infrastructure, including initialization, shutdown, native engine integration, and resource lifecycle management. Focused on predictable behavior and reliable interaction with client applications.
- **Concurrency & Reliability:** Investigated and resolved complex multithreading issues, improving thread safety, shared-state consistency, and reliability of critical SDK components and lifecycle operations.
- **SDK Architecture & Public API Design:** Contributed to the design and evolution of public SDK APIs, reviewing existing interfaces and improving API contracts, configuration management, and internal architecture to enhance usability, consistency, and maintainability.
- **Engineering Quality & AI-Assisted Development:** Applied test-driven development (RED → GREEN) combined with AI coding agents to systematically reproduce complex defects, validate solutions, and deliver focused, regression-tested changes through code reviews.

Automotive Navigation Application (Previous Project)

Project outline: Developed an Android navigation application installed in vehicles, focused on offline maps, startup lifecycle, routing flows, and state reliability in an automotive environment.

Tools and technologies: Kotlin, Jetpack Compose, Coroutines, Flows, Hilt, MVVM, MVI, Mapbox.

Key Contributions & Impact

- **Offline Maps System:** Designed and fully implemented the offline maps feature end-to-end — download coordination, tile versioning, migration flows, and reactive UI state — under a tight summer deadline (including weekends). Enabled users to download regional maps and navigate fully offline in production vehicles.
- **Application Startup Stabilization:** Owned and stabilized the full vehicle startup flow — splash screen, startup controller, map initialization, and migration chain (3–30 sec window) — replacing fragile imperative logic with a reactive architecture. Reduced startup-related crashes and improved cold-start reliability across the fleet.
- **Separation of UI and Business Logic:** Extracted data transformation logic from Compose UI layer into dedicated mappers and use cases, decoupling views from data models. Made both the UI and business logic independently testable and reduced onboarding time for new developers on the module.

Senior Android Developer at Zalando (via Zoolatech)

(Part-time Contract)

Aug 2025 – Oct 2025

Project outline: Worked on the Zalando Android app — a large-scale fashion and lifestyle e-commerce product used across Europe. Joined on a short-term contract to support Product Details delivery and migration-related work under tight timelines.

Key Contributions & Impact

- **Product Details Delivery:** Accelerated delivery of the Product Details feature under a tight migration deadline, contributing directly to the on-time completion of a critical migration milestone for the Zalando Android app.

Android Developer at Relevant Software

MileIQ — US-based automatic mileage tracking app

May 2020 – June 2024

Project outline: Developed a module for MileIQ, a US-based mobile application that automatically tracks driving distances in the background. Helps users distinguish between personal and business trips and generates reports for trip compensation.

Tools and technologies: Kotlin, Jetpack Compose, Coroutines and Flows, Retrofit, Google Maps API.

Key Contributions & Impact

- **Native Rewrite of Drives Module:** Rewrote the drives module from React Native to native Android (Kotlin + Compose) — built search screen, list editing with complex custom animations, caching layer, and undo functionality (3-second rollback window for deletions). Eliminated platform-specific bugs and improved UI responsiveness.

- **Introduced Reactive Architecture Pattern:** Established a UseCase-driven reactive pattern (UseCases → Repositories → Mappers → clean UI State) that replaced a deeply coupled MVVM with nested ViewModels. This pattern was adopted by other teams and reused across subsequent modules, becoming the standard approach on the project.
- **Jetpack Compose Adoption:** Championed Jetpack Compose as the standard for all new modules instead of XML layouts, accelerating UI development speed by an estimated 30–40%.

Android Developer at Relevant Software

eSIM Travel App (Kotlin Multiplatform)

(within May 2020 – June 2024)

Project outline: Hybrid application for simplifying international travel by allowing users to choose, purchase, and activate an eSIM when crossing borders, avoiding roaming fees.

Tools and technologies: Kotlin, Jetpack Compose, Kotlin Multiplatform, PreCompose, Ktor, Coroutines, Koin.

Key Contributions & Impact

- **Cross-Platform eSIM Flow:** Implemented the full eSIM selection, purchase, and activation flow on Kotlin Multiplatform — shared business logic between iOS and Android, reducing code duplication and accelerating feature parity across platforms.

Android Developer at Relevant Software

Svenn — Time Tracking for Construction

(within May 2020 – June 2024)

Project outline: Time tracking application for construction workers with project management, deviation reporting, image editing, and internal chat features.

Tools and technologies: Kotlin, Coroutines & Flow, Navigation Component, JUnit, Mockito, GetStream, Realm.

Key Contributions & Impact

- **Java-to-Kotlin Migration:** Led migration of the codebase from 90% Java to 95% Kotlin — accelerated new feature delivery, simplified maintenance, and made the project more attractive for hiring Kotlin-native developers.
- **Testing Culture:** Initiated unit testing practice from scratch; wrote ~150 tests covering core business logic. Reduced regression rate on releases and improved architectural encapsulation as a side effect.
- **RxJava → Coroutines Migration:** Migrated async layer from RxJava to Kotlin Coroutines/Flow — simplified async code, reduced lifecycle-related bugs, and lowered the learning curve for new team members.

Senior Android Developer at FinTech Startup

(Side Project)

October 2022 – September 2023

Project outline: Investment portfolio app allowing users to buy and sell assets. Primary responsibility was to uplift the project onto a new backend while retaining the existing MVI/Redux architecture.

Tools and technologies: Kotlin, Koin, MVI/Redux, 20+ modules, Gradle Kotlin DSL, App Links.

Key Contributions & Impact

- **Backend Migration:** Uplifted the entire MVI/Redux codebase (20+ modules) onto a new backend without breaking existing functionality — ensured a seamless transition for end users with zero downtime.

Senior Android Developer at GlobalLogic

GemOne — Industrial Vehicle Tablet App (Part-time Contract)

May 2021 – September 2022

Project outline: Android application preinstalled on a tablet integrated into warehouse vehicles. Provides drivers with vehicle status information, calibrates data, and relays it to the server.

Tools and technologies: Kotlin, Google Protocol Buffers, Coroutines & Flows, Navigation Component, Hilt, JUnit, Mockito.

Key Contributions & Impact

- **Built from Scratch:** Developed the full Android application from zero for a tablet embedded in warehouse vehicles — established USB communication layer using Google Protocol Buffers and TLV packets for reliable hardware-to-app data exchange.
- **Clean Architecture from Day One:** Implemented Clean Architecture (MVVM, use cases, repositories, UsbDataSource) from the project's inception — enabled the team to scale features without accumulating technical debt.

Android Developer at Ciklum

Seetree — Agricultural Mapping Platform

January 2018 – April 2020

Project outline: Farm mapping application for presenting and modifying geo-objects (trees, polygons) on a map with heavy reliance on offline capability due to poor internet coverage at farm locations.

Tools and technologies: Firestore, Room, Mapbox, Kotlin Coroutines, JUnit, Mockito, RxJava, Dagger2, MVVM.

Key Contributions & Impact

- **Offline-First Data Sync:** Built a robust offline synchronization system (Firestore + Room + custom cache layer) for field use on farms with no internet coverage. Guaranteed 100% data upload and sync upon connectivity restoration regardless of connection quality.
- **God-Class Decomposition:** Refactored the main map screen — where ~80% of all app functionality lived in a single ViewModel and Fragment (God-classes with imperative logic and global variables) — into reactive, encapsulated use cases. Radically simplified maintenance of the most critical screen in the application.
- **Comprehensive Test Coverage:** Wrote ~700 unit tests (CI via Bitbucket Pipelines) and ~30 instrumentation tests (Firebase Test Lab), establishing a reliable quality gate for releases.
- **Direct Client Collaboration:** Cooperated directly with US and Israeli clients on a daily basis, including on-site business trips, ensuring alignment between technical delivery and business requirements.

Android Developer at Tickets.UA

Avia & Railway Ticket Apps

March 2014 – December 2017

Project outline: Developed Tickets Avia, Tickets Railway, KiyAvia, MAU, and several white-label products. Apps provide users with a convenient way to buy and manage air and railway tickets. Joined as a trainee, grew to manage a team of two developers.

Tools and technologies: Java, Kotlin, RxJava, Coroutines, Unit Testing, Google/Facebook Sign In, MVP.

Key Contributions & Impact

- **White-Label Architecture:** Organized shared business logic into reusable modules for white-label products — enabled rapid rollout of custom-branded ticket apps for partner companies without code duplication.
- **Quality & Modern Practices:** Introduced unit testing (~500 tests), Kotlin adoption, and Clean Architecture layers — reduced production incidents and improved long-term code maintainability.
- **Team Growth & Mentoring:** Grew and led a team of 2 developers; mentored 9 newcomers over the course of career — 8 of whom now work professionally as Android engineers.

Other side projects (Early Career)

2014 – 2017

- Magnet fridge. Bluetooth, communication with Arduino bluetooth module, payments via app.
- Adster. Sharing promo codes in social networks. Facebook API, Vkontakte API, Google+ API.
- +1. Stores different quantity indicators. Room, MVVM, DB backup on Google Drive.
- Ratio Counter. Calculates direct and indirect proportions. Simple calculator.
- Calorie Counter. Calculates and tracks calories. SqliteOpenHelper, Widgets, Retrofit.
- Work Pace. Sticky service, Local Broadcast receivers, AlarmManager.

Engineer at Lviv Polytechnic National University

March 2012 — March 2014

- Supporting documentation flow at the Department of Internal Quality Assurance.
- Gathering data and compiling final plans and reports on educational and research performance indicators.
- Conducting internal audit of documentation for compliance with university and Ministry of Education policies.

Education

Lviv Polytechnic National University

September 2007 – June 2012

Additional highlights

- Kotlin/Android educational YouTube channel — 4,000+ subscribers
- Direct collaboration with US and Israeli clients
- Strong mentoring background and onboarding experience
